

Matalino AI Website - Deployment Troubleshooting Guide

Diagnostic Commands

Quick Health Check

```
# Navigate to project directory
cd /home/ubuntu/matalino-ai-website/app

# Check git status and recent commits
git status
git log -5 --oneline

# Verify environment variables
echo "NEXTAUTH_URL: $NEXTAUTH_URL"
echo "DATABASE_URL: $DATABASE_URL"

# Test database connection
npx prisma db pull

# Check build status
yarn build

# Verify server is running
ps aux | grep -E "(next|node)" | grep -v grep
```

Common Issues & Solutions

1. “Freemium Features Not Appearing”

Symptoms:

- Pricing page shows old content
- Authentication not working
- Dashboard not accessible

Diagnosis Steps:

```
# Check if latest code is deployed
git log -1 --oneline

# Verify build includes latest changes
ls -la .next/server/app/pricing/
cat .next/server/app/pricing/page.js | grep -i "pro\|free"

# Check if environment variables are loaded
node -e "console.log('NEXTAUTH_URL:', process.env.NEXTAUTH_URL)"
```

Solutions:

1. Force rebuild and restart:

```

```bash
Kill existing processes
pkill -f "next|node"

Clear cache and rebuild
rm -rf .next .build
yarn install
yarn build

Restart development server
yarn dev
```

```

1. Check database migrations:

```

bash
npx prisma migrate status
npx prisma migrate deploy
npx prisma generate

```

2. “Authentication System Not Working”

Symptoms:

- Sign-in page not loading
- Users can't register
- Session not persisting

Diagnosis:

```

# Check NextAuth configuration
cat app/api/auth/[...nextauth]/route.ts

# Verify database tables exist
npx prisma studio
# Or check via SQL
npx prisma db execute --stdin <<< "SELECT table_name FROM information_schema.tables
WHERE table_schema = 'public';"

```

Solutions:

1. Fix environment variables:

```

bash
# Update .env file
cat > app/.env << EOF
DATABASE_URL="postgresql://
role_83eb1ba10:YoJDXEs0ssIU3Q05kvU9HDQ3sehkBsBD@db-83eb1ba10.db001.hosteddb.reai.io:
5432/83eb1ba10"
NEXTAUTH_URL="http://localhost:3000"
NEXTAUTH_SECRET="$(openssl rand -base64 32)"
STRIPE_SECRET_KEY="sk_test_your_stripe_secret_key_here"
STRIPE_PUBLISHABLE_KEY="pk_test_your_stripe_publishable_key_here"
STRIPE_WEBHOOK_SECRET="whsec_your_webhook_secret_here"

```

```
STRIPE_PRICE_ID="price_your_price_id_here"
EOF
```

1. Reset and recreate database:

```
bash
npx prisma migrate reset --force
npx prisma migrate dev --name init
npx prisma generate
```

3. “Stripe Integration Not Working”

Symptoms:

- Payment buttons not working
- Webhook errors
- Subscription status not updating

Diagnosis:

```
# Check Stripe configuration
grep -r "STRIPE" app/.env
grep -r "stripe" app/lib/

# Test webhook endpoint
curl -X POST http://localhost:3000/api/webhooks/stripe \
  -H "Content-Type: application/json" \
  -d '{"test": true}'
```

Solutions:

1. Update Stripe configuration:

```
bash
# Verify Stripe keys are correct format
echo "Secret key should start with: sk_test_ or sk_live_"
echo "Publishable key should start with: pk_test_ or pk_live_"
```

1. Test Stripe webhook locally:

```
``bash
# Install Stripe CLI
curl -s https://packages.stripe.com/api/security/keypair/stripe-cli-gpg/public | gpg --dearmor | sudo tee /usr/share/
keyrings/stripe.gpg
echo "deb [signed-by=/usr/share/keyrings/stripe.gpg] https://packages.stripe.com/stripe-cli-debian-local stable
main" | sudo tee -a /etc/apt/sources.list.d/stripe.list
sudo apt update
sudo apt install stripe

# Forward webhooks to local server
stripe listen --forward-to localhost:3000/api/webhooks/stripe
...`
```

4. “Build Failures”

Symptoms:

- yarn build fails
- TypeScript errors
- Missing dependencies

Diagnosis:

```
# Check for TypeScript errors
npx tsc --noEmit

# Verify dependencies
yarn install --check-files

# Check for missing files
find app -name "*.tsx" -o -name "*.ts" | xargs grep -l "import.*from.*\.\./" | head -5
```

Solutions:**1. Fix dependency issues:**

```
```bash
Clean install
rm -rf node_modules yarn.lock
yarn install

Fix peer dependency warnings
yarn add prettier@latest
yarn add eslint@^8.57.0
```
```

1. Fix TypeScript errors:

```
```bash
Check specific errors
npx tsc --noEmit --pretty

Update TypeScript configuration if needed
cat > app/tsconfig.json << 'EOF'
{
 "compilerOptions": {
 "lib": ["dom", "dom.iterable", "es6"],
 "allowJs": true,
 "skipLibCheck": true,
 "strict": true,
 "noEmit": true,
 "esModuleInterop": true,
 "module": "esnext",
 "moduleResolution": "bundler",
 "resolveJsonModule": true,
 "isolatedModules": true,
 "jsx": "preserve",
 "incremental": true,
 "plugins": [
 {
 "name": "next"
 }
],
 "baseUrl": ".",
 "paths": {
 "@/*": ["/"]
 }
 }
}
```

```

}
},
"include": ["next-env.d.ts", "/*.ts", "/*.tsx", ".next/types/**/*.ts"],
"exclude": ["node_modules"]
}
EOF
```

```

5. “Database Connection Issues”

Symptoms:

- Prisma commands fail
- Database queries timeout
- Migration errors

Diagnosis:

```

# Test database connection
npx prisma db pull

# Check database URL format
echo $DATABASE_URL | grep -E "postgresql://.*:.*@.*:.*/"

# Verify database exists
npx prisma db execute --stdin <<< "SELECT version();"

```

Solutions:

1. Fix database connection:

```

``bash
# Test connection with psql
psql "postgresql://
role_83eb1ba10:YoJDXEs0sslU3Q05kvU9HDQ3sehkBsBD@db-83eb1ba10.db001.hosteddb.reai.io:
5432/83eb1ba10" -c "SELECT version();"

# If connection fails, check network/firewall
telnet db-83eb1ba10.db001.hosteddb.reai.io 5432
```

```

#### 1. Reset database schema:

```

``bash
Backup current data (if needed)
npx prisma db execute --stdin <<< "CREATE TABLE backup_users AS SELECT * FROM "User";" || true

Reset and recreate
npx prisma migrate reset --force
npx prisma migrate dev --name init
```

```

Advanced Troubleshooting

Performance Issues

```
# Check memory usage
free -h
ps aux --sort=-%mem | head -10

# Monitor Next.js performance
yarn build --debug
```

Network Issues

```
# Check port availability
netstat -tulpn | grep :3000

# Test external connectivity
curl -I http://localhost:3000
```

File Permission Issues

```
# Fix permissions
sudo chown -R ubuntu:ubuntu /home/ubuntu/matalino-ai-website
chmod -R 755 /home/ubuntu/matalino-ai-website
```

Deployment Verification Script

Create and run this verification script:

```
#!/bin/bash
# Save as verify-deployment.sh

echo "  Matalino AI Deployment Verification"
echo "===== "

cd /home/ubuntu/matalino-ai-website/app

# Check environment
echo "  Checking environment variables..."
if [ -z "$NEXTAUTH_URL" ]; then echo "  NEXTAUTH_URL not set"; else echo "  NEXTAUTH_URL: $NEXTAUTH_URL"; fi
if [ -z "$DATABASE_URL" ]; then echo "  DATABASE_URL not set"; else echo "  DATABASE_URL configured"; fi

# Check database
echo "  Testing database connection..."
if npx prisma db pull > /dev/null 2>&1; then
  echo "  Database connection successful"
else
  echo "  Database connection failed"
fi

# Check build
echo "  Testing build..."
if yarn build > /dev/null 2>&1; then
  echo "  Build successful"
else
  echo "  Build failed"
fi

# Check server
echo "  Checking server status..."
if pgrep -f "next" > /dev/null; then
  echo "  Next.js server running"
else
  echo "  Next.js server not running"
fi

echo "===== "
echo "  Verification complete!"
```

Run with:

```
chmod +x verify-deployment.sh
./verify-deployment.sh
```

Emergency Recovery

Complete Reset (Last Resort)

```
# Stop all processes
pkill -f "next\|node"

# Clean everything
rm -rf .next .build node_modules

# Reinstall and rebuild
yarn install
npx prisma generate
npx prisma migrate deploy
yarn build

# Restart
yarn dev
```

Rollback to Working State

```
# If you have git history
git log --oneline -10
git checkout <working-commit-hash>
yarn install && yarn build && yarn dev
```

Getting Help

1. **Check logs:** Always check the latest log files in `.logs/` directory
2. **Browser console:** Check for JavaScript errors in browser dev tools
3. **Network tab:** Verify API calls are working
4. **Database logs:** Check database server logs if available

Remember: Always backup your database before making major changes!
